

Hermes Agent setup (Lab 14, optional demo)

Multi AI Agents Workflow for Content Creation (Claude Edition) · Day 2 · Hermes Agent (profiles, Kanban) — trainer demo

Hermes Agent is Nous Research's open-source (MIT) agent. It runs on your machine, works with many model providers, keeps memory and skills, runs a Kanban board for teams of agents, and talks to you through bots on Telegram, Discord, Slack, WhatsApp, Signal or email.

1. Install (macOS, Linux, WSL2):

```
curl -fsSL https://hermes-agent.nousresearch.com/install.sh | bash
```

(Windows: use the PowerShell one-liner on the Hermes site.)

2. `hermes setup` — choose a provider and model. A Claude **subscription**

does not cover Hermes: use the Anthropic API key or OpenRouter key your trainer issues (spend-limited, revoked after class).

3. `hermes` — say hello to check it works. `/exit` to leave.

4. Profiles are separate agents — each has its own config, model, memory,

skills and bot: `~/.hermes/profiles/<name>/`

5. Copy the studio skills into each profile:

```
cp -R skills/* ~/.hermes/profiles/<name>/skills/
```
